Foreword

Summaries

Thank you for choosing the SPI-B-H series (175K-250K) string PV grid-tied inverter (Hereinafter referred to as inverter)!

This document gives a description of the inverter, including appearance, features, working principles, installation, electrical connection, operation, maintenance and storage, etc.

Please save the manual after reading, in order to consult in the future.

NOTE
The figures in this manual are just for reference, for details please see the actual product.

Applicable Model

- SPI175K-B-H
- SPI200K-B-H
- SPI225K-B-H
- SPI250K-B-H

Symbol Conventions

The manual quotes the safety symbols, these symbols used to prompt users to comply with safety matters during installation, operation and maintenance. Safety symbol meaning as follows.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>⚠️ DANGER</td>
<td>Alerts you to a high risk hazard that could, if not avoided, result in serious injury or death.</td>
</tr>
<tr>
<td>⚠️ WARNING</td>
<td>Alerts you to a medium or low risk hazard that could, if not avoided, result in moderate or minor injury.</td>
</tr>
<tr>
<td>Symbol</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>⚠️ CAUTION</td>
<td>Alerts you to a potentially hazardous situation that could, if not avoided, result in equipment damage, data loss, performance deterioration, or unanticipated results.</td>
</tr>
<tr>
<td>⚠️</td>
<td>Anti-static prompting.</td>
</tr>
<tr>
<td>⚠️</td>
<td>Be care electric shock prompting.</td>
</tr>
<tr>
<td>💡 TIP</td>
<td>Provides a tip that may help you solve a problem or save time.</td>
</tr>
<tr>
<td>📖 NOTE</td>
<td>Provides additional information to emphasize or supplement important points in the main text.</td>
</tr>
</tbody>

1 Safety Description

This chapter mainly describes the safety announcements. Prior to performing any work on the device, please read the user manual carefully, follow the operation and installation instructions and observe all danger, warning and safety information.

1.1 Safety Announcements

This section mainly describes the safety announcements when operation and maintenance. For details, please refer to safety description in relevant chapters.

---

⚠️ CAUTION

Before operation, please read the announcements and operation instructions in this section carefully to avoid accident.

The promptings in the user manual, such as "Danger", "Warning", "Caution", etc. don't include all safety announcements. They are just only the supplement of safety announcements when operation.

---

💡 NOTE

Any device damage caused by violating the general safety operation requirements or safety standards of design, production, and usage will be out of Kehua's guarantee range.

1.1.1 Use Announcements

---

⚠️ DANGER

Don't touch terminals or conductors that connected with grid to avoid lethal risk!
DANGER

There is no operational part inside the inverter. Please do not open the crust of the inverter by yourself, or it may cause electric shock. The device damage caused by illegal operation is out of the guarantee range.

DANGER

After disconnect the input and output of the inverter, there still has residual energy in the storage capacitor, which may cause electric shock. Do not perform the maintenance until all power sources are switched off for 30 minutes.

WARNING

Please do not put fingers or tools into the rotating fans to avoid human injury or device damage.

HIGH TEMPERATURE

The surface temperature of the inverter may reach to 75°C. During running, please don't touch the surface to avoid scald.

CAUTION

No liquid or other objects are allowed to enter the inverter, or, it may cause inverter damage.

WARNING

In case of fire, please use dry power fire extinguisher. If using liquid fire extinguisher, it may cause electric shock.
1.1.2 PV String Protection

When install PV string in daytime, it necessary to cover the PV string by light-proof material, or the PV string will generate high voltage under sunshine. If touching PV string accidently, it may cause electric shock or human injury!

---

**DANGER**

There exists dangerous voltage between the positive and negative of PV string!

When installing the device, make sure that the connection between inverter and PV string has been disconnected completely. And set warning mark in the disconnected position to avoid reconnecting.

---

1.1.3 ESD Protection

---

**CAUTION**

To prevent human electrostatic damaging sensitive components (such as circuit board), make sure that you wear a anti-static wrist strap before touching sensitive components, and the other end is well grounded.

---

1.1.4 Grounding Requirements

---

**WARNING**

High leakage risk! The inverter must be grounded before wiring. The grounding terminal must be connected to ground, or, there will be the risk of electric shock when touching the inverter.

- When installing, the inverter must be grounded first. When dismantling, the grounding wire must be removed at last;
- Don't damage the grounding conductor;
- The inverter must be connected to protection grounding permanently.
- Before operation, check the electrical connection to ensure the inverter is grounded reliably.
1.1.5 Moistureproof Protection

⚠️ CAUTION

Moisture invasion may cause inverter damage!

Observe the following items to ensure the inverter works normally.

- When the air humidity is more than 95%, don't open the door of the inverter;
- In the wet or damp weather, don't open the door of the inverter to maintain or repair.

1.1.6 Warning Mark Setting

In order to avoid accident for unwanted person gets close to the inverter or makes improper operation, observe the following requirements while installing, maintaining or repairing.

- Set warning marks where the switches are to avoid switching them on improperly.
- Set warning signs or safety warning belt in the operation area, which is to avoid human injury or device damage.

1.1.7 Electrical Connection

Electrical connection must be performed according to the description in the user manual and the electrical circuit schematic.

⚠️ WARNING

The configuration of PV string, grid level, grid frequency, etc. must meet the technical requirements of inverter.

Grid-tied generation should be allowed by the local power supply department and the related operation should be performed by professionals.

All electrical connection must meet the related country and district standard.
1.1.8 Measurement Under Operation

⚠️ CAUTION
There exists high voltage in the device. If touching device accidently, it may cause electric shock. So, when perform measurement under operation, it must take protection measure(such as wear insulated gloves, etc.)

The measuring device must meet the following requirements:

- The range and operation requirements of measuring device meets the site requirements;
- The connections for measuring device should be correct and standard to avoid arcing.

1.2 Operator Requirements

⚠️ CAUTION
The operation and wiring for inverter should be performed by qualified person, which is to ensure that the electrical connection meets the related standards.

The professional technicist must meet the following requirements:

- Be trained strictly and understand all safety announcements and master correct operations.
- Fully familiar with the structure and working principle of the whole PV grid-tied generation system.
- Know well about the related standards of local country and district.
2 Overview

This chapter mainly describes product appearance, structure, working principle and communication method, etc.

2.1 Product Intro

The inverter converts the DC energy from PV string into AC energy and then feedbacks to power grid, which is suitable for the large power station grid-tied system. The PV grid-tied generation system consists of PV string, PV grid-tied inverter, transformer and power distribution system, as shown in Figure2-1.

![PV grid-tied generation system](image)

Figure2-1 PV grid-tied generation system

---

**CAUTION**

PV grid-tied power generation needs to obtain the permission of local power supply department and performed by professionals.

---

**NOTE**

The grid form supported by the inverter is shown in Figure2-2.
2.1.1 Features

- Innovated three level design, with high transition efficiency.
- Support PLC communication, night SVG function, which satisfies the requirement of grid scheduling.
- The reactive power is adjustable, the range of power factor is -0.8(lag)~+0.8(ahead).
- Smart I-V scanning, fault wave capture, remote online update function.
- Perfect protection functions: island protection, high/low voltage ride through, reverse DC connection protection, AC short circuit protection, leakage current protection, surge protection, etc.

2.1.2 Model Meaning

- **SPI □□□K-B-H**
  - **Voltage type mark**
    - “H” represents high-voltage.
  - **Isolation type mark**
    - “B” represents non-isolated power.
  - **Rated output power mark**
    - When it is 175, that means the rated power of the UPS is 175kVA;
      When it is 225, that means the rated power of the UPS is 225kVA;
      And so on.
  - **Product series mark**
    - SPI series PV grid-tied inverter.

Figure 2-3 Model meaning
2.2 Appearance and Structure

2.2.1 Appearance

The appearance of SPI-B-H series string PV grid-tied inverter is as shown in Figure 2-4.

![Figure 2-4 Appearance](image)

2.2.2 Operation Panel

There are 4 status indicators on the front panel of the inverter, which can indicate the current working status of the inverter. The status of each indicator is shown in Table 2-1.

![Figure 2-5 Operation Panel](image)

<table>

### 2.2.3 Bottom Layout

The inverter's bottom layout is shown as Figure2-6.

![Figure 2-6 Bottom Layout](image)

**NOTE**

SPI175K-B-H has 18 groups PV string inputs. The connection identifiers MPPT10+ ~ MPPT12+, MPPT10- ~ MPPT12- in Figure 2-6 are not installed with PV connectors.

The above figure takes SPI225K-B-H as an example to illustrate. If there is no special explanation, the following we will take SPI225K-B-H as an example to explain.

DC Switch

The DC switch (the position is shown as ② in Figure 2-6) is the connection switch between the inverter and the PV string, when necessary, it can safely disconnect the connection of the inverter and the PV string. In order to ensure the safety of the operator, make sure that the DC switch is turned off under the following conditions:

- When installing and wiring, the DC switch must be placed to OFF position.
- When checking and repairing, place the DC switch to OFF position and wait for 30 minutes. Use a multimeter to measure the DC bus voltage inside the inverter, only when the voltage lower than 10V, you can perform repair work.
2.2.4 Size

![Size Diagram](image)

Figure 2-7 Size (unit: mm)

2.3 Working Principle

The PV string input is connected to the inverter, and the maximum power point for the PV string is tracked through the internal 12 groups of MPPT circuits to achieve the maximum power output of the PV string, and then the conversion of DC power to three-phase AC power is realized through the inverter circuit, as shown in Figure 2-8.

![Working Principle Diagram](image)

Figure 2-8 Working principle diagram

2.4 Communication

The inverter has multiple communication methods, including Ethernet communication, RS485 communication, WIFI/GPRS communication (optional), and PLC communication (optional). Users can easily obtain the current operation data of the inverter.

2.4.1 Ethernet Communication

Ethernet communication (the interface is shown in Figure 2-9) is mainly used for local area network monitoring, which can realize the background remote monitoring.
2.4.2 RS485 Communication

RS485 communication (the interface is shown in Figure2-11) is mainly used for local area network monitoring, which can realize the background remote monitoring.
When there is only one inverter communicates via RS485, choose one of the two communication interfaces to connect.

2.4.3 WIFI/GPRS Communication (Optional)

WIFI/GPRS communication is mainly used for remote monitoring, and the running information of the inverter can be monitored through APP on mobile phone or energy cloud on PC. WIFI/GPRS interface is shown as ○ in Figure2-6.
Figure 2-13 WIFI/GPRS monitoring solution

![Diagram of WIFI/GPRS monitoring solution]

**NOTE**

The APP can build communication between WIFI or GPRS wireless communication module and inverter. Via APP, the near-end and far-end maintenance and monitor of the inverter can come true. User can query the inverter information, alarm, event and set the parameters by the APP.

**Download and installation:**

- **Method 1:** download the APP via following application market.
  1. Application market (for Android user).
  2. APP store (iOS).
- **Method 2:** scan the QR code below to download and install the APP in accordance with the prompting.

![QR code of APP]

Figure 2-14 QR code of APP

### 2.4.4 PLC Communication (Optional)

If the inverter is equipped with PLC communication, Kehua sub-array controller needs to be configured. The output end of the inverter must pass through the isolation transformer and then be connected to grid, as shown in Figure 2-15.
The setting of PLC communication address is the same as that of RS485, details please see 3.6.8 COM. Communication Connection.

CAUTION

If PLC communication is configured, the AC cables can only be multi-core cable, single-core cable cannot be used.

Sub-array controller

Smart sub-array controller is designed base on an outdoor cabinet. Data collector, RS485 signal SPD, PID module and inductor, optical cable terminal box, PLC module, SPD, etc. can be installed in the cabinet to realize the communication and control for sub-array of PV power station.
2.4.5 PID Function (Optional)

If PID function is configured and enabled, the voltage of all PV string to ground is greater than zero, that is to say, the voltage of all PV string to ground is positive voltage status.

---

⚠️ CAUTION

- Before enable PID protection or repair function, please pay attention to the polarity requirement for the voltage of different PV string to ground. If any question, please contact the manufacturer of PV string or read the user manual of PV string.

- When the type of PV string mismatch the voltage scheme of PID protection or repair function, the PID function will not reach the expected effect even cause harmful influence for PV string.
PID repair function

When the inverter not running, the PID function module add reverse voltage for PV string to repair the PV string which has occurred the PID effect.

**NOTE**
After enable PID repair function, it only works at night.

After enable PID repair function, the default voltage of PV string to ground 500Vdc.
3 Installation

This chapter mainly introduces the inverter's installation, including installation process, installation preparation, handling, unpacking and checking, installation procedures, electrical connection, check the installation, etc.

3.1 Installation Process

The installation process of the inverter is as shown in Figure3-1.

Figure3-1 Installation process

3.2 Installation Tools

The recommended installation tools include but not limited to the following tools, if necessary, you can also use other auxiliary tools according to the site conditions.
## Tools

</tbody>
</table>
3.3 Selection of Installation Site

3.3.1 Installation Environment

The use environment has a certain influence on the service life and reliability of the inverter. Therefore, please pay attention to avoid using it in following working environment.

- Do not install the inverter in high or low temperature or humid places that exceed the technical specifications (temperature: -35℃~60℃, relative humidity: 0%~100%)
- Do not install the inverter in closed space, ensure good ventilation around the inverter.
- There must be no flammable or explosive materials or with dust, corrosive substances, or salt in the installation environment
As the operation of inverter will produce noise pollution, avoid installing them near residential areas as far as possible.

**NOTE**
Choose the best installation location for the inverter, which plays a very important role in its safe operation, service life, performance guarantee, etc. Therefore, it is recommended to choose a place that can avoid direct sunlight, rain, and snow. As shown in Figure3-3.

- Keep a clearance of at least 800mm from the left side and right side of the inverter to other objects, keep at least 600mm from the top of the inverter to ceiling and at least 450mm from the bottom of the inverter to ground, which is good for heat dissipation or maintenance, as shown in Figure3-4.
The installation height of the inverter should be easy to check the status of the indicator lights, connect wires, operate and maintain, etc. The recommended space between bottom inverter and ground is 600~800mm.

**NOTE**

We suggest not installing the inverter at upper and lowering at the same time, which is to avoid influence the heat dissipation of the inverter.

- When multiple inverters are installed side by side, a certain distance must be reserved between the inverters, as shown in Figure3-5.

**CAUTION**

- When the inverters are installed back to back, a certain distance must be reserved between the two inverters, as shown in Figure3-6.
3.3.3 Requirements for Installation Carrier

The installation carrier of the inverter (such as walls and brackets) should meet the requirements shown in Figure3-7.

Figure3-7 Installation carrier requirements

3.3.4 Installation Method

It is recommended to install the inverter vertically or obliquely backwards (with an angle of $\leq 15^\circ$ from the vertical plane). It cannot be tilted forward or inverted installed.
Because the inverter is downward air inlet and the upper air outlet, in order to ensure the normal operation of the inverter, it is not recommended to install it horizontally.

### 3.4 Transporting, Unpacking and Checking

#### 3.4.1 Transporting

Before installation, the inverter needs to be transported to the selected installation site. When transporting, you can carry the inverter by the handle or the ring according to the scene.

Handle transporting

---

![Figure 3-8 Illustration of installation method](image)

![Figure 3-9 Handle transporting](image)
NOTE
The handle is an accessory. When transporting, they need to be installed to corresponding position and tightened.
It is recommended that carry the inverter by at least 4 people and wear protective equipment such as smash-proof shoes and gloves.

CAUTION
- While handling, move the inverter carefully to avoid impact or fall.
- During transporting, always pay attention to the gravity center of the inverter, do not suddenly put it down or lift it up.
- Putting the inverter directly on a hard ground will damage the terminals of the inverter or the case, it is necessary to lay protective materials such as sponge pads or foam underneath it.

Ring transporting

Figure3-10 Ring transporting

NOTE
The hoist ring is an optional accessory. When the hoist rings are required for transportation, they must be selected first, and install them onto the top of the inverter tightly on the site.
3.4.2 Unpacking and Checking

**NOTE**
Determine the unpacking site in advance. Normally, the unpacking site should be as close to installation position as possible.

The inverter has been completely tested and strictly inspected before leaving the factory, but damage may still occur during transporting, so a detailed inspection is required after arrival.

- Inspect the inverter’s appearance for shipping damage, if any shipping damage is found, report it to the carrier immediately.

- Check if the types of the accessories are complete and correct. If there is any discrepancy, take notes and contact the distributor immediately.

---

**CAUTION**

After unpacking, if the inverter will be stored for a long time, it's recommended to pack the inverter with original plastic package.

---End

3.5 Inverter Installation

The inverter can be installed on the wall or metal bracket via equipped installation holder.

3.5.1 Bracket Installation

Step 1 Use the four M4*10 combination bolts in accessories to fix the installation holder with the joint lever, as shown in Figure 3-11.
Figure 3-11 Assemble installation holder

Step 2 Place the assembled installation holder onto the installation site, use a horizontal ruler to adjust the angle, and mark the position of the hole on the bracket, as shown in Figure 3-12.

**CAUTION**

Please ensure that the wall mount is level to ensure that the mounting holes are consistent and aligned.

Figure 3-12 Mark the mounting holes position

**NOTE**

You can also directly mark the location of the holes according to the size of the mounting holes (see Figure 3-13).
Step 3 Use the electric drill to drill holes on the bracket according to the marked position. The drilling size is Ф12mm, as shown in Figure3-14.

![Figure3-13 Mounting hole size (unit: mm)](image)

Step 4 Fix the installation holder to the bracket, use M10*40 bolts, put on flat washers, spring washers and nuts, and then tighten the nuts clockwise with a wrench, as shown in Figure3-15.

![Figure3-15 Fix installation holder](image)
Step 5 Lift the inverter to the installation holder, make sure that the mounting ears of the inverter and the groove of the installation holder fit well, and then slowly hang the inverter to the installation holder, as shown in Figure3-16.

![Figure3-16 Hang the inverter onto the installation holder](image)

**CAUTION**

Do not loosen the inverter until it fixed firmly.

Step 6 Use the screws M5*50 in the accessories to fix the inverter, as shown in Figure3-17.

![Figure3-17 Fix inverter](image)
3.5.2 Wall Mounting

Step 1  Use the four M4*10 combination bolts in accessories to fix the installation holder with the joint lever, as shown in Figure3-18.

Figure3-18 Assemble installation holder

Step 2  Place the assembled installation holder onto the installation site, use a horizontal ruler to adjust the angle, and mark the position of the hole on the wall, as shown in Figure3-19.

--- End ---
You can also directly mark the location of the holes according to the size of the mounting holes (see Figure3-20).

![Figure3-20 Mounting hole size (unit: mm)](image)

**Step 3**  According to the marked position, use a hammer drill to drill holes on the wall. Drilling hole size is $\Phi 14.5$mm, depth range is 55~60mm.

![Figure3-21 Drilling holes](image)

**CAUTION**

After drilling, please clean the residues in the holes, and measure the depth of each hole to ensure that the depth of each hole is the same.

**Step 4**  Install expansion bolts. Install the four M10*80 expansion bolts into the installation holes, as shown in Figure3-22.
Step 5  Install the installation holder. Fix the installation holder to the expansion bolts, put on flat washers, spring washers and nuts, and then tighten the nuts clockwise with a wrench, as shown in Figure3-23.

Step 6  Lift the inverter to the installation holder, make sure that the mounting ears of the inverter and the groove of the installation holder fit well, and then slowly hang the inverter to the installation holder, as shown in Figure3-24.
Figure 3-24 Hang the inverter onto the installation holder

**CAUTION**

After confirming that the inverter is fixed firmly, the operator can release the equipment.

**Step 7** Use the screws M5*50 in the accessories to fix the inverter, as shown in Figure 3-25.

Figure 3-25 Fix inverter

----End
3.6 Electrical Connection

3.6.1 Safety Announcements

During operating, professionals must wear protective equipment.

---

**DANGER**

- High voltage may exist in the inverter.
- PV string exposed to sunlight will generate dangerous voltage.
- Do not close the DC switches and external AC breaker before completing the electrical connection.
- Make sure that all cables without electricity before wiring.

---

**WARNING**

- Any improper operation during wiring may cause equipment damage or human injury, so, wiring operation must be performed only by professional technicians.
- The cables used in the PV power generation system must be firmly connected, intact, well insulated and with appropriate specifications.

---

**CAUTION**

- The wiring process must follow the relevant rules of the local power grid and the relevant safety instructions of the PV string.
- All electrical installations must comply with the electrical standards of the country or local region.
- The inverter can only be integrated into the power grid after obtaining permission from the local power department.

3.6.2 Requirements for Wire

The wiring terminals are located at the bottom of the inverter (as shown in Figure2-6). The recommended wires and terminals are as shown in Table3-1.
### 3.6.3 External Grounding Connection

#### WARNING

- Since the inverter is with no transformer, it is required that the positive and negative poles of the PV string cannot be grounded, otherwise the inverter will not operate normally.
- Before the AC side, PV string and communication connection, please connect the external grounding wire first.

#### NOTE

- The cables in above table are based on UL copper wire. If other wires are used, please replace them according to the standard. The wire materials selected by our company have passed the national standard certification or UL certification.
- If the recommended terminal model is not adopted, please confirm with our company.
- If using the aluminum wire, it should adopt copper-aluminum transition terminal.

---

**Table 3-1 Wire and terminal requirements**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
The grounding connection of the external grounding terminal cannot replace the connection of the internal grounding terminal. Make sure that both of them are grounded reliably, otherwise Kehua Company will not be in charge of the responsibility for possible consequences.

Step 1 Strip the insulation layer of the grounding wire by crimping tool, and press it into the corresponding terminal, as shown in Figure3-26.

![Grounding wire stripping diagram](image)

Figure3-26 Grounding wire stripping diagram

**NOTE**
It is recommended to use DT or OT terminal for the external grounding wire.

Step 2 Connect the crimped grounding wire to the external grounding terminal at the bottom of the inverter, as shown in Figure3-27.

![Schematic diagram of the ground connection](image)

Figure3-27 Schematic diagram of the ground connection

**NOTE**
Two external grounding terminals are reserved at the bottom of the inverter, at least one of them should be connected.

In order to improve the anti-corrosion performance of the grounding terminal, it is recommended to paint anti-rust paint on the outside of the grounding terminal for protection after installation.
3.6.4 AC Output Wiring

CAUTION

Before connecting to the grid, first make sure that the grid voltage and frequency meet the requirements of the inverter. For details, please see A Technical Specifications. Otherwise, please contact the electricity company to solve.

Each inverter should be equipped with an independent external three-pole breaker on the AC side to ensure that the inverter is safely disconnected from the grid. Recommended breaker’s rated voltage is 800V, rated current is 250A.

NOTE
If several inverters need to share a breaker, the breaker needs to be selected according to the total current.
CAUTION

No load can be connected between the inverter and the breaker.

Medium-voltage transformer

The configured medium-voltage transformer must meet the following requirements:

- The selected transformer can be distribution transformer, which matches the PV system of typical periodicity load (that is to say, in daytime, there is load, at night, there is no load). You can choose dry type transformer or oil-immersed transformer, shielding winding is not required.

- The line voltage at low-voltage side of the transformer must meet the output line voltage of inverter's AC side. When connecting with IT type grid, the ground resistance requirements of the winding at low-voltage side of boost transformer, AC wires and secondary device (including relay protection device, detection meter and related auxiliary equipment) must not less than 1100V.

- The output line voltage at high voltage side of the transformer must be in accord with the voltage level of local grid. We suggest selecting the transformer with tapped switch at the high voltage side.

- When the temperature around the transformer is 45℃, the transformer should be able to operate for a long time under 1.1 times overload. The selected transformer must be with overload protection and short circuit protection.

- It is recommended to use the transformer whose short circuit impedance equal to 6% (allowable error ±10%), and at the same time, the voltage drop of system wires should be not more than 3%.

- The bearable DC component of the transformer should be 1% of the fundamental current in rated power.

- The apparent power of inverter cannot exceed the power of the transformer. Considering the max. AC current of all paralleled inverters.

- Considering the bearable ability of the transformer if system faults. The fault includes system short circuit, grounding fault, voltage drop, etc.

- When selecting and installing the transformer, the environment condition, such as temperature, humidity, altitude, air quality, of local site must be taken into account.
Terminal requirements

- When the AC output uses copper wire, it is recommended to use DT/OT terminals (as shown in Figure3-29). The terminal specifications and requirements is: $13\text{mm} \leq A \leq 15.5\text{mm}$, $B \leq 46\text{mm}$, $C \leq 22\text{mm}$.

![Figure3-29 Terminal size requirements](image)

- When the AC output uses aluminum wire, copper-aluminum transition terminal is required to avoid direct contact between the copper bar and the aluminum wire.

Wiring steps

---

**CAUTION**

Before wiring, add marks for AC output cables to avoid wrong connection.

---

Step 1  Open the cover of the right-side wiring box by wrench, as shown in Figure3-30.

![Figure3-30 Open the wiring cover](image)
A limiting lever is designed inside the wiring box. After the wiring cover is opened, the limiting lever needs to be fixed (as shown in Figure 3.31) to facilitate the wiring operation.

Figure 3.31 Operation diagram of limiting lever

Step 2 Loosen the external forced cable fixing head of AC terminal, lead the L1, L2, L3 wires go through the external forced cable fixing head, and use a wire stripper to strip the L1, L2 and L3 respectively, and crimp them to the terminal, and then connect to the AC output terminal block, as shown in Figure 3.32.

Figure 3.32 Connect the AC output cable
NOTE
The torque used to tighten the external forced cable fixing head of AC wiring is about 15~19Nm.

CAUTION
In order to avoid excessive stress on the cable, the AC cable needs to enter the inverter vertically, and the external length of the straight section should be not less than 200mm, as shown in Figure3-33.

Figure3-33 AC cable entry requirements (unit: mm)

NOTE
- When leaving the factory, outlet end of the cable seal ring is in a sealed status. Before connecting, puncture it by tool.
- Please connect the AC output wire according to the relevant requirements of different countries.

Step 3  Tighten the externally forced cable fixing head of the AC terminal clockwise, using a fireproof mud cable gap.

----End
3.6.5 Internal Grounding Connection

Loosen the external forced cable fixing head of the inner grounding terminal, lead the grounding wire go through the external forced cable fixing head, use a wire stripper to strip the grounding wire and crimp it to the grounding terminal, and then connect it to the inner grounding bar, as shown in Figure3-34.

![Figure3-34 Connect internal grounding cable](image)

**NOTE**
The torque used to tighten the externally forced cable fixing head of the inner grounding wire is about 10~13N·m.

3.6.6 PV String Input Wiring

---

**DANGER**
Pay attention to safety before electrical connection, the PV string will produce dangerous voltage when exposed to sunlight.

---
WARNING

If the DC input wires are reverse connected by accident and the "DC SWITCH" have been set to the "ON", do not immediately operate the "DC SWITCH" and the positive and negative connectors, or, it may cause inverter damage. The resulted inverter damage is not covered by warranty. It needs to wait until night when the solar irradiance decreases and the PV string current drops below 0.5A, then place the corresponding "DC SWITCH" to "OFF" position, remove the positive and negative connectors and correct the polarity of the PV string.

CAUTION

- Before connecting the PV string to the inverter, ensure that the PV string is well insulated from ground.
- When installing, use the DC terminals and PV connectors in the accessories, or, the inverter will be damaged. If they are lost or damaged by accident, please purchase the same type of PV connector. Inverter damage caused by the using incompatible PV connectors is not covered by the warranty.
- Disconnect the DC switches before connecting the PV string.
- Make sure that the positive and negative poles of the PV string and the inverter are correctly connected.
- Ensure that the DC input voltage is less than 1500Vdc, and the maximum short-circuit current of the PV string is within the allowable range of the inverter.
- It is strictly prohibited to connect the positive and negative poles of PV string to ground, or, it will cause damage to the inverter.

Use the PV connectors and terminals in the accessories for DC input wiring. There are two types of PV connectors: positive and negative connectors, which respectively use positive metal terminals and negative metal terminals. The specific steps are as follows.

Connect PV connectors

Step 1  Use a wire stripper to strip the insulation layer of the positive and negative cables by 7mm, as shown in Figure3-35.
Figure 3-35 Schematic diagram of stripping DC input wiring (Unit: mm)

**NOTE**

It is recommended to use red for positive cables and black for negative cables to avoid wiring errors. If other colors are used, please confirm the corresponding relationship when crimping each cable to the connector.

Step 2  
Loosen the lock nuts of the positive and negative connectors, lead the positive and negative cables go through the corresponding lock nuts, and use a crimping tool to press the positive cable and negative cable to the positive and negative metal terminals respectively, as shown in Figure 3-36.

Figure 3-36 Crimp metal terminals

Step 3  
Insert the crimped positive and negative cables into the corresponding insulating shells until you hear a clicking sound, it means the connection is completed.

Figure 3-37 Fixed metal terminal

Step 4  
Screw and tighten the locking nuts of the positive and negative connectors to corresponding insulating shells, as shown in Figure 3-38.

Figure 3-38 Tighten the lock nut
Wiring illustration for type-Y PV connector

---End

**CAUTION**

When wiring by type-Y PV connector, the type of all connectors must match that of the inverter. If using the connector with different manufacturer or different type together, the contact resistance of the connector may exceed the allowable value, it will continue to heat and oxidize and easy to break down.

**Wiring principle:**

- For each MPPT, at most one set PV connector of type-Y can be connected.
- The PV+ of inverter side must be connected to the PV+ of PV string side, the PV- of inverter side must be connected to the PV- of PV string side. They cannot be connected mixed.

![Wiring diagram (connected from inverter side)](image-url)
Install PV connectors

Step 1  Confirm that all DC switches on the inverter (shown as \(\textcircled{2}\) in Figure3-41) are OFF.

Step 2  Check whether the polarity of the PV string is correct, and ensure that the open-circuit voltage in any case not exceeds the maximum input voltage of the inverter 1500V.
Step 3  Insert the positive and negative connectors into the MPPT "+" and "-" terminals on the bottom of the inverter respectively (as shown in Figure 3-43). When you hear a click, it means the connection is completed.

![NOTE]
Each MPPT must have PV string connected.

![Figure3-43 Connect PV connectors]

---

![CAUTION]
If any PV connector on the inverter is not connected to PV string, block it with original plug.

---End

3.6.7 WIFI/GPRS Communication Connection (Optional)

If WIFI/GPRS stick is configured, insert it into the WIFI/GPRS port to monitor, as shown in Figure 3-44.

![Figure3-44 WIFI/GPRS communication connection]
3 Installation

CAUTION

When connecting, pay attention to the limiting position, and don’t wrongly insert it. When tightening, do not use excessive force (torque: 1.5~2.0N•m), so as not to damage the interface.

NOTE

● The GPRS do not need to set.
● For the use of WiFi and GPRS, please scan the QR code on the WIFI/GPRS.

3.6.8 COM. Communication Connection

COM. communication includes Ethernet communication and RS485 communication.

Step 1 Loosen the external forced cable fixing head of "COM.", and then lead the communication cable go through the external forced cable fixing head.

Step 2 Connect the communication wire.

● Ethernet communication connection

Crimp the Ethernet communication wire according to Figure3-45, and then plug it into the Ethernet port on the communication board, as shown in Figure3-46. Connect the other end to the monitoring platform or router.

Figure3–45 Diagram of crimping of Ethernet communication wire
RS485 communication connection

Connect the RS485 communication wires to the RS485 port on the communication board, as shown in Figure3-47, and connect the other end to the monitoring platform.
3 Installation

Critical 

CAUTION

- When connecting, do not press the insulation layer of the communication cable into terminal, otherwise it may cause poor contact.
- The RS485 communication wire must be routed separately from the input and output wires to avoid interference with communication.

**NOTE**

The baud rate of the inverter needs to be set through Kehua monitoring software WiseEnergy (for details, please refer to the About-User Manual in WiseEnergy). The default baud rate is 9600. The communication address of the inverter is set in binary mode through the dial switch SW1 (position shown in Figure 3-48) on the communication board, for example: when the dial switch SW1 is set to "000001 (from left to right, ON is 1, OFF is 0)", which means the communication address of the inverter is 1, and so on. If in doubt, please contact the manufacturer.

![Figure 3-48 Position of SW1](image)

**NOTE**

When multiple inverters are communicating, the dial switches SW3 on the communication boards of first and last inverter on the communication link must be switched to the ON position.
CAUTION

The communication address of the inverter must not conflict.

Step 3  After connecting, tighten the external forced cable fixing head, seal with fireproof mud and install the cover plate.

----End

3.7 Check the Installation

After installation, check the following items:

- Check if the connection of DC input, AC output and communication wire are right.
- Check if the inverter is installed firmly.
- Check if all the screws on the surface of the inverter are tightened.
4 Startup and Shutdown

This chapter mainly introduces how to start and shut down the inverter.

4.1 Check Before Startup

Before first startup, please check the following items first.

- Ensure that the inverter is properly installed and fastened.
- Ensure that the DC switches and external AC breakers are all disconnected.
- Ensure that the input polarity of PV string is correct.
- Ensure that all wires are fastened and the cable sheath with no damage.
- Ensure that the gap between connector and wires and unconnected connector has been sealed up and filled with fireproofing mud.
- Ensure that the grid voltage meets the AC voltage requirement of the inverter.
- Ensure that the input cables meet the current requirements of max. load.
- Ensure that the distance among AC terminals meet the requirements of safety standard.
- Ensure that the input voltage of each PV string in accordance with each other's.

4.2 Start Inverter

⚠️ DANGER

Damaged device or device fault may cause electric shock or fire!

- Before operation, please check if the inverter is damaged or has other danger.
- Check the external device or circuit connection and see if it is safe.

After ensure the inverter is normal, start the inverter according to following steps.
Step 1  Switch on the DC switches on the inverter and the project site. When the PV string provides enough startup voltage, PV string indicator will be on.

Step 2  Switch on the AC switch between inverter and grid, the fault indicator off.

Step 3  When the DC and AC power are all normal, the inverter will prepare to start.

Step 4  A moment later, the inverter will generate power normally. The grid indicator will be on.

----End

4.3 Shut Down Inverter

WARNING

When the inverter is in normal operating, it is strictly prohibited to disconnect the switches at DC and AC side under load to avoid the risk of arc damage to the switch. In severe cases, the inverter may be damaged.

Step 1  Switch off the external AC switch between the inverter and grid.

Step 2  Switch off the DC switches on the inverter and project site, after awhile, PV string indicator light off.

----End
5 Maintenance and Troubleshooting

This chapter mainly describes the maintenance and troubleshooting.

5.1 Maintenance

**NOTE**
If any maintenance service is needed, please contact the after-sale service centre of Kehua Company, otherwise, Kehua Company will not undertake the responsibility and guarantee for the loss caused by self-operation.

**CAUTION**
For human safety, before check and maintenance, disconnect the external AC switch, and then switch off the DC switches on the inverter. Wait for 30min, measure the inner DC bus voltage by multimeter and ensure the voltage below 10V, and then the maintenance can be done.

5.1.1 Maintenance Details and Period

To ensure the inverter works in best condition, we suggest maintaining the inverter regularly.

**Table 5-1 Check list**

<table>
<thead>
<tr>
<th>Item</th>
<th>Check method</th>
<th>Maintenance period</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cleanness of system</td>
<td>Check if there is dust or sundries on air outlet holes or heat sink. Clean the air outlet holes and heat sink if necessary</td>
<td>Every half or one year (it is decided by the dust of the environment)</td>
</tr>
<tr>
<td>Electric connection</td>
<td>Check if the wiring is loose or dropping. Check if there is damage on the cables, especially the surface touching with metal, if damaged, please</td>
<td>Every half or one year</td>
</tr>
</tbody>
</table>
### 5.1.2 Maintenance Guide

#### Clean wind inlet & outlet holes

During operating, the inverter will generate large heat, so, the inverter designs the cooling way of forced wind-cooling. To ensure good ventilation, it is necessary to check the wind inlet & outlet holes.
and keep them unblocked. If necessary, a soft brush can be used to clean the wind inlet & outlet holes.

Fan maintenance

---

**WARNING**

Before maintenance, shut down the inverter and disconnect all power input.

Wait for 30min at least, after the inner capacitor discharge completely, the maintenance can be done.

The maintenance and replacement for fan only can be done by professional electric person.

The inner fans are used for cooling and heat dissipation while operating. If the fans cannot work normally, it will influence the inverter efficiency or cause derating running. So, keep the fan clean and replace the damaged fan in time. The fan's cleanness and replacement procedure as follows.

**Step 1** Shut down the inverter (see 4.3 Shut Down Inverter).

**Step 2** Loosen the screws of fan module, as shown in Figure5-1.

**Figure5-1 Loosen the screws of fan cover**

**Step 3** Pull out the fan module gently and loosen the connector of fan.
Figure 5-2 loosen the wiring of fan module

Step 4  Pull out the fan module, clean the fan by brush or cleaner or replace damaged fan.

Figure 5-3 Pull out fan module

Step 5  Install the fan module in reversed order and lock the screws, restart the inverter.

----End
5.2 Troubleshooting

The inverter is designed on the basis of the grid-tied operation standards and meets the requirements of safety and EMC. Before provided to client, the inverter has been experienced for several rigorous tests to ensure reliable and optimizing operation.

If some faults occur, the touch screen will show the corresponding alarm information. Under the circumstances, the inverter may stop power generation. The fault situation is as shown in Table5-2.

</tbody>
</table>
If the inverter has an alarm mentioned in Table 5-2, please shut down inverter (refer to 4.3 Shut Down Inverter), 5 minutes later, restart the inverter (refer to 4.2 Start Inverter). If the alarm status is not removed, please contact our local agency or service center. Before contacting us, please prepare the following information.

1. Inverter S/N.
2. Distributor/dealer of the inverter (if has).
3. The date of grid-tied power generation.
4. Problem description.
5. Your detail contact information.
6 Stop Running, Dismantle, Discard Inverter

This chapter introduces the dispose way for stop running, dismantling, discarding the inverter.

6.1 Stop Running

Normally, the inverter don't need to be shut down, but when maintenance, it is necessary to shut down the inverter.

CAUTION

Please disconnect the AC and DC connection of inverter according to following procedure successively, or, it may cause human injure or device damage.

Step 1  Disconnect the external AC breaker, and set warning marks at disconnected site to avoid improperly switching and even cause accident.

Step 2  Switch OFF the DC switches on the inverter.

Step 3  Wait for 30min at least, ensure that the inner capacitor discharge completely.

Step 4  Loosen the locked part of PV string connector by MC4 wrench, take down the PV string connectors.

Step 5  Dismantle the AC wiring box, measure the wires and ensure that there is no electricity in the AC wires, and then dismantle the AC wires and communication wires.

Step 6  Install waterproof plug MC4 and AC waterproof box.

----End
6.2 Dismantle the Inverter

**WARNING**

After the connection among inverter and grid and PV string is completely disconnected and wait for 30min at least, ensure that the inner capacitor discharge completely, and then the inverter can be dismanted.

---

**Step 1** Dismantle the inverter in reversed procedure of **3.6 Electrical Connection**.

**Step 2** Dismantle the inverter in reversed procedure of **3.5 Inverter Installation**.

**Step 3** If the inverter will be installed and used in the future, please dismantle the installation holder on the wall or bracket, then package and store the inverter properly. (see **7.1 Package** and **7.3 Storage**).

----End

6.3 Discard the Inverter

For the inverter that certain not to be used, user needs to discard the inverter according to related provision.

**CAUTION**

The battery, module and other components inside the inverter may pollute the environment, please do corresponding dispose on the basis of related provision.
This chapter mainly describes the package, transportation and storage.

7.1 Package

The package of product is carton. When packing, pay attention to the placing direction requirements. One side of carton, it should print warning icons, including keep dry, handle with care, up, stacking layer limit, etc. The other side of carton, it should print the device model, etc. Print the logo of Kehua company and device name on the front of carton.

7.2 Transportation

Pay attention to the warnings on the carton. Don't impact severely when transportation. In case of damaging device, it should follow the placing direction that shows on the carton. Don't carry device with the objects that inflammable, explosive, or corrosive. Don't put device in the open-air warehouse when transshipment. Leaching and mechanical damage by rain, snow or liquid objects is prohibited.

7.3 Storage

When storing device, it should follow the placing direction that shows on the carton. The gap is 20cm between the carton and ground and the clearance is at least 50cm from carton to wall, heat source, cold source, windows or air inlet.

The storage environment temperature is -40℃~70℃. If storing or transporting device beyond the working temperature, before startup, set it alone and wait for the temperature reaches to the range of the working temperature and keep the status more than four hours. In warehouse, It's prohibited that there has poisonous gas, objects that inflammable and explosive, corrosive chemical objects. Besides, it shouldn't have too strong mechanical shaking, impact and strong magnetic field. Under the storage conditions above, the storage period is six months. If it is beyond six months, it has to recheck.

Do not store the inverter in the open air. If it will be stored for long time, please check the tightness of the inverter and see if there is any abnormal inside the inverter.

- Specifications are subject to change without prior notice.
B Quality Assurance

If the device fault in guarantee period, Kehua Hengsheng Co., Ltd. (hereinafter referred to as Kehua Company) will maintenance it free or replace new product.

Evidence

In guarantee period, user needs to show the purchase invoice of the product, and the trademark on the product must be clearly visible, or, Kehua Company have right to refuse the quality assurance.

Condition

- The replaced product must be returned to Kehua Company to dispose.
- Reasonable time should be reserved for Kehua Company to maintain the fault device.

Disclaimer

If any situation below occurs, Kehua Company have right to refuse the quality assurance.

- Beyond the free quality assurance period.
- Damaged by transportation.
- Improper installation, transformation or use.
- Used in the harsh environment that not allowed in the User Manual.
- Damaged by installation, maintenance, transformation or dismantling of other company server.
- Damaged by using component or software of non-standard or other company except Kehua Company.
- Beyond the installation and use range of related national standard.
Damage caused by abnormal nature environment.

If the fault is caused by above situation and user requires to maintain it, we can provide paid maintenance service after our service organization decided.

To improve users' satisfaction continuously, our product and User Manual is upgrading. If the User Manual has difference with product, it may be caused by the version difference, please take the actual product as standard. If any question, please contact our company.

Software authorization

- It is prohibited to use part or whole data of the hardware or software of Kehua Company in any way for commercial purpose.
- It is prohibited to decompile, decrypt or destroy the original program design of the software developed by Kehua Company.
